

Coronavirus Disease 2019 (COVID-19) is an infectious disease caused by severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2). It was first identified in December 2019 in Wuhan, China, and has resulted in an ongoing pandemic. This first confirmed case has been traced back to 17 November 2019. Traces of the virus have been found in December -2019 wastewater that was collected from Milan and Turin. As of June 2020, more than 8.71 million cases have been reported across 188 countries and territories, resulting in more than 461,000 deaths. More than 4.28 million people have recovered. Estimated Active Cases Around the world:

Monitoring the spread of the Coronavirus by measuring only the confirmed and death cases can be depressing. Let's think positively and take a look at the recovered cases. We create our own measure for estimated recovered cases. & Active cases

Let's make an assumption that it takes an average of X days to recover from the virus. So, on any given day, the number of recovered cases equal to the number of confirmed cases we had X days ago minus the number of new deaths in the passing period. To calculate the estimated recovered cases, we first need to calculate the total deaths. Create a new measure for the **estimated active cases** by subtracting the total confirmed cases by the estimated recovered cases.
